Upgrade information on Phazer turbo kit:

We and many of our customers have made a lot of test with our Phazer turbo sleds. We have found some things that can improve the turbo system. The rubber hose from the turbo to the aluminium hose under the tank is getting to hot from the heat of the exhaust system. We insulated the exhaust pipe by wrapping heat insulation material on the pipe.

The intensive heat on the rubber hose is gone. We also get one more advantage from the insulation. The turbo response is getting faster. We recommend taking away the clamp between the stock exhaust system and the MCX exhaust pipe to the turbo. Weld the joint instead with a MIG or TIG welding machine. This makes the wrapping to become nicer and the turbo unit can't come loose any longer.

The muffler exhaust outlet pointing towards the track is not a suitable setup. When driving in deep snow, the engine starts to misfire. We recommend cutting the pipe a little and welding on a 90 degree tube bend so the exhaust pipe is pointing backwards instead. This makes the engine run clean even in deep snow.

Within a couple of days, we will send you the parts you need for the recommended upgrades without cost so you can let your customers take advantage of the latest knowledge.

Best regards Erik Marklund
